

*Self-Directed Learning***Improving Client-Provider  
Interaction and Counseling**

Alternative and blended learning approaches are cornerstones of PRIME II's global leadership in Responsive Training and Learning. From Bangladesh to Benin, PRIME II has designed and implemented a variety of self-directed and distance learning projects to meet infrastructural and financial challenges and avoid interruptions in service delivery by training primary providers using alternatives to classroom training. Results from the scale-up of a pilot project in Ghana to improve the quality and accessibility of adolescent family planning and reproductive health services show that self-directed learning (SDL) continues to strengthen the ability of private-sector midwives to counsel and interact with their adolescent clients.

**Reviewing Results in PRIME II**

Oct. 2001–Sept. 2002

## Case Studies:

- Kenya PAC
- Bangladesh RTL
- Dominican Republic RTL
- Ghana PI

- Francophone PAC/Nigeria MAQ

**Background:** PRIME developed the SDL pilot project in collaboration with the Ghana Registered Midwives Association (GRMA) in response to a 1997 assessment of midwives' capabilities in family planning and reproductive health service delivery. The assessment highlighted the need for improved counseling and client-provider interaction (CPI) skills and emphasized the importance of increased access to services for adolescents. Implementation of the pilot project began in 1999 for 60 midwives in the regions of Brong Ahafo, Eastern and Ashanti. All but one of the midwives completed the SDL course. As PRIME II reported in its 2001 Results Review, an evaluation comparing 30 participating midwives with 30 non-participants showed that the SDL learners had a significantly higher overall CPI observation score than non-participants (74% vs. 54%). The evaluation also found that after completing the course participating midwives were much more likely to offer adolescents STI diagnosis and treatment, condoms, emergency contraception and postabortion care. With the addition of a new module on HIV counseling and testing, PRIME II and GRMA scaled-up the project to an additional 52 midwives from the same three regions in 2001-2002.

**Interventions:** The seven-month SDL course blends multiple learning approaches for knowledge and skills acquisition. Print modules containing practical exercises and self-assessments are supplemented with paired learning activities, visits by facilitators and monthly group "peer review" meetings that allow opportunities for feedback and problem-solving. Learner support includes tools and equipment as well as guidance on structuring time for study and practice. The interrelated

learning components of the SDL course include counseling, community outreach, family planning updates and STI/HIV prevention.

**Results:** A June 2002 evaluation of 43 of the 52 midwives participating in the scale-up of the SDL project used observations of simulated exchanges to compare baseline and post-intervention mean scores of their performance in various aspects of CPI related to serving adolescent clients. The midwives showed only slight improvement in the two areas of CPI skills in which they had scored highest at baseline, Establishing Rapport and Maintaining a Good Connection (87% vs. 86%) and Gathering Information and Listening (68% vs. 67%). However, significant gains were made in areas where their skills needed more improvement: Providing Information and Explanation (78% vs. 50%), Decision Making and Problem Solving (69.5% vs. 30%) and Planning Next Steps (79.5% vs. 36%). Overall post-intervention and baseline CPI scores for these midwives (77% vs. 54%) are very similar to the results from the evaluation of the pilot intervention and reflect a high level of performance for these primary providers. GRMA has been asked to replicate the SDL approach in the seven other regions of Ghana, though no budgetary allocations have yet been made.
